

Introduction to Massively Parallel Databases

Wes Reing

- ✦ 10 + Years of Production Databases
- ✦ DataXu
- ✦ 100TB MPP Databases
- ✦ Twitter: @wreing
- ✦ Web: reing.com

What I Will Cover

- ✦ What purpose do MPPs serve
- ✦ How they work in theory
- ✦ Practical usage tips

Big Data

How Big is Big?

Bigger than a Single Postgres

Approximately 1 to 2 TB

Options

- ✦ Map Reduce / Distributed File System
- ✦ NoSQL
- ✦ Sharding
- ✦ MPP

Map Reduce / Distribute FS

- ✦ Runs great on commodity hardware
- ✦ Schemaless
- ✦ SQL support is not great
- ✦ Hadoop, MapR
- ✦ SQL support with Hive, Impala

NoSQL

- ✦ Scale to Multiple Servers
- ✦ Key Value Storage
- ✦ Non-Relational
- ✦ Limited
- ✦ Limited Transaction Support
- ✦ MongoDB, FoundationDB, Spanner, Riak

Sharding

Split the data on a key

- ✦ Company
- ✦ Date

MPP

- ✦ A Master node acts like a traditional DB
- ✦ Lots of segment nodes split up the work
- ✦ Can Support Transactions and Indexes
- ✦ Many of the pros and cons of traditional DBs

MPP

- ✦ No foreign Keys
- ✦ No functions that access tables

Greenplum

Master Node

Segment Node

Segment Node

Segment Node

Segment Node

Segment Node

Segment Node 1

Primary Segments

Mirror Segments

Columnar Databases

- ✦ MPP Does not require Columnar Data Stores
- ✦ Most vendor implementations do use Columnar DBs
- ✦ Redshift, Greenplum, Vertica
- ✦ Greenplum allows both

Columnar Databases

- ✦ Imagine each column is a separate table
- ✦ Especially good for warehouse applications
- ✦ Not good for applications with large numbers of updates

Distributing the data

- ✧ Distributed by Key
 - ✧ $(\text{Key} \% \# \text{ of segments}) = \text{Segment}$
- ✧ Distributed Randomly

Choosing a good key

- ✦ Minimize Skew
- ✦ Distribute fact tables that will be joined with the same key
 - ✦ Employee ID
 - ✦ User ID
 - ✦ Order ID

Distribution Keys

Segment 7

Students

ID	Name
46	John Smith
57	Jane Student

Class_Student

Class	Student
848	46
197	23

Segment 32

Students

ID	Name
33	Paul Learner
99	Sally Edu

Class_Student

Class	Student
197	99
52	99

Distribution - Greenplum

```
CREATE TABLE students
(id          INT PRIMARY KEY,
name        CHAR(50),
address     CHAR(200),
gpa         NUMERIC,
enrolled_on DATA
) DISTRIBUTE BY (id);
```

Partitioning

Orders

ID	Date	Item

Orders_2014

ID	Date	Item
95	2014	USB
87	2014	Headphone

Orders_2013

ID	Date	Item
52	2013	Cord
43	2013	Laptop

Orders_2012

ID	Date	Item
23	2012	TV
16	2012	USB

Partitioning

- ✦ Works in addition to distribution
- ✦ Supported in Greenplum, Vertica
- ✦ Not Supported in Redshift

Partitioning - Greenplum

- ✦ Defined in the create table statement
- ✦ Two levels of partitioning supported
- ✦ Keep the number of total partition down

Partitioning - Greenplum

```
CREATE TABLE students
(id          INT PRIMARY KEY,
 name        CHAR(50),
 address     CHAR(200),
 gpa         NUMERIC,
 enrolled_on DATE
)
DISTRIBUTE BY (id)
PARTITION BY RANGE(enrolled_on)
(START (date '2010-01-01') INCLUSIVE
 END   (date '2015-01-01') EXCLUSIVE
 EVERY (INTERVAL '1 month'));
```

Partitioning - Vertica

- ✦ Defined in the Create Statement
- ✦ Partition by Expression
- ✦ No more than 12 partitions per table

System Design

- ✦ Network Bandwidth
- ✦ Disk IO
- ✦ Processors

Network

- ✦ 10 Gigabit
- ✦ Segregated from other Traffic
- ✦ gpcheckperf

Disk IO

- ✦ SSD - RAID - 10k Magnetic
- ✦ Need to Balance Speed, Reliability and Cost
- ✦ Faliures

Processors and Memory

- ✦ Memory. You will need a lot
- ✦ CPUs are the largest factor in choosing Segments per Node
- ✦ One Core per Segment

Comparison - Greenplum

- ✦ Very full featured SQL
- ✦ Available as an appliance, and as software only
- ✦ Very sensitive to hardware

Comparison - Vertica

- ✦ Columnar from the ground up
- ✦ Projections

Comparison - Redshift

- ✦ Based on Paracel
- ✦ Lots of Progress
- ✦ Limited SQL

Tips - Greenplum

Distinct Can Be Slow

```
SELECT DISTINCT classes  
FROM students;
```

```
SELECT classes  
FROM students  
GROUP BY classes;
```

Tips - Greenplum

```
CREATE TABLE temporary_users  
as  
SELECT id, town, income  
FROM users  
where income > 20,000;
```
